

THE CAREGIVER COGNITIVE-LOAD AGENT

Less to carry. More care *to give*.

A shared care picture.

A clear next step. A caregiver in control.

Care Plan Care Circle Care Organizer Care Handover

Frincy Clement · Maneetta Antony · Shrijan Chipalu · Tejaswini Venkata Raju

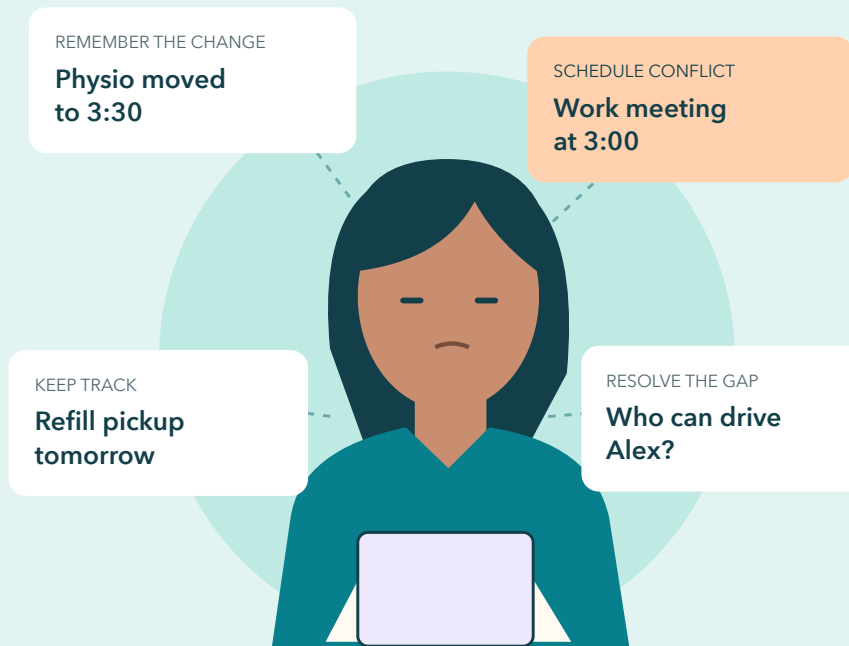

ONE CAREGIVER. TOO MUCH TO REMEMBER.

Everyone has part of the story. Maya holds it *all together.*

She coordinates Alex's care around work and family—remembering every change and resolving schedule conflicts again and again.

THE INVISIBLE WORK OF CARE

Keep the information in her head.
Spot the clash. Find cover. Update everyone.

Maya · daughter, caregiver, coordinator

Illustrative persona and scenario

Care happens across people. The mental checklist stays with one.

A FAMILIAR COORDINATION GAP

“I thought you were taking Alex tomorrow.”

The appointment changes

The ride still points to the old plan.

Ownership is unclear

Two people assume the other has it.

Maya reconstructs the story

Messages, reminders, and follow-up calls.

Small gaps can disrupt essential care

A missed pickup or unconfirmed ride can leave an important responsibility unfinished.

Every handover costs attention

The next caregiver needs the current situation, open issues, and reliable contacts.

More reminders are only part of the answer

The practical need is shared context, a named owner, and a visible outcome.

Enable Maya to coordinate the next step without rebuilding the whole picture.

You Care. We Plan.

Maya can hand over context, priorities, and responsibilities together.

Care Plan

A foundation for each recipient: personal context, preferences, contacts, and a reusable plan.

Care Circle

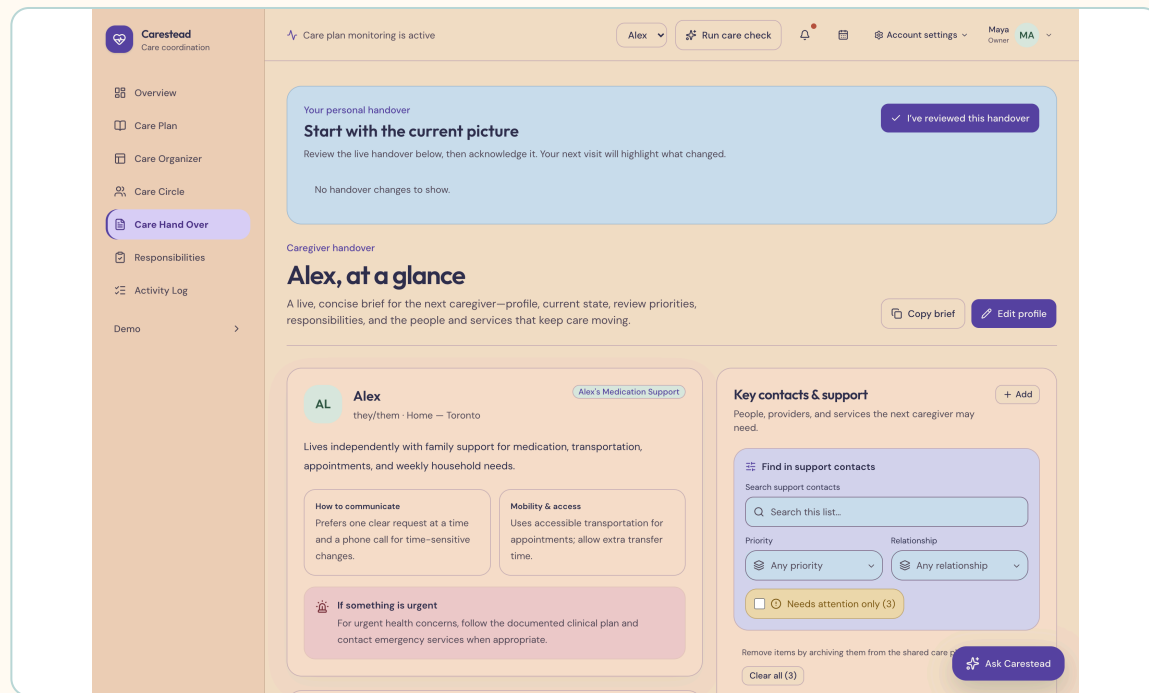

Bring family and caregivers together with clear roles, shared responsibilities, and named support.

Care Organizer

Plan a break, outing, or coverage need. Review the responsibilities and schedule that make it possible.

Care Handover

A concise, live handover: what changed, what needs attention, and who owns the next step.

Current app · Care Hand Over · synthetic recipient records

From “What needs attention?” to a reviewed action.

Ask in the moment

Recipient-specific text chat returns a summary with expandable supporting evidence.

Prepare a concrete change

Reschedule an appointment, assign a ride, add a responsibility, run a check, or draft an in-app update.

Approve, then record the result

An authorized caregiver reviews the action. The app executes it and saves the outcome and audit trail.

Voice option: browser dictation and spoken replies, where supported. Raw audio is not retained by Carestead.

Captured workflow updates Carestead · connected calendars use Calendar

Implementation: app/api/chat/route.ts · components/care-chat.tsx

The screenshot displays a mobile application interface for reviewing a task. At the top, an orange box contains the text: "I prepared this action but have not changed anything yet. Review the details and approve it if they are correct." Below this, another orange box titled "Evidence used · 2" contains two sections: "PROPOSED TOOL" with the text "reschedule task", and "SAFETY POLICY" with the text "Explicit caregiver approval is required before any chat-initiated write." At the bottom, a light green box shows the task details: "Approval required" (in a pill), "RESCHEDULE TASK", and "Move 'Physiotherapy appointment' to Sep 13, 3:30 PM." At the very bottom of this green box are two buttons: a purple "✓ Approve" button and an orange "✕ Cancel" button.

Current app · reviewed rescheduling proposal with visible evidence

Say what you need. Review the next step in chat.

1 Speak naturally

Use the microphone to dictate a question or request. Review the transcript before sending.

2 Hear and see the answer

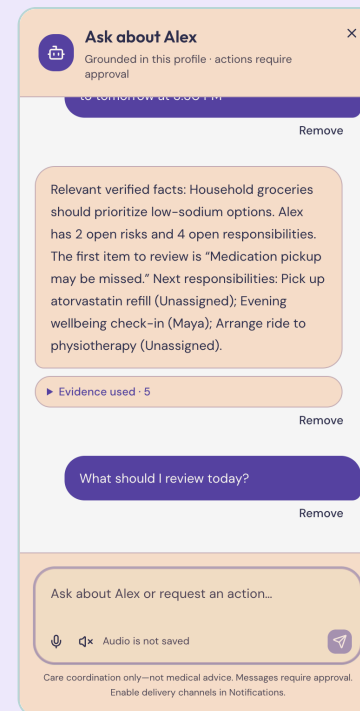

Ask “What should I review today?” Get a recipient-specific summary with visible evidence and optional spoken replies.

3 Turn a request into an action

Ask to move physiotherapy to 3:30. Review the proposed change in chat, then approve or cancel.

Voice input → same grounded chat and approval flow

Browser support and microphone permission required. Carestead retains transcript text, not raw audio.

Current app · grounded answer, evidence, and voice controls

One shared place for the work around care.

Care recipient & profile

Personal context, preferences, access notes, and contacts.

Care Organizer

Breaks, outings, respite, and reviewed coverage plans.

Calendar scheduling

Events, conflicts, and approved Google Calendar changes.

Voice interaction

Speech input and spoken replies; transcript-only retention.

Notifications Multichannel

Recipient-scoped notices, held for approval when required.
In-app · Email · SMS · Browser Push · Mobile Push
External channels require setup and opt-in.

Care plan & templates

Versioned plans, personal overrides, and safe reuse.

Care Handover

Current context, unresolved risks, and the next responsibilities.

Activity logs

Changes, approvals, actions, and outcomes in sequence.

Risk checks & approvals

Explainable checks with review before consequential actions.

Authentication & privacy

Accounts, roles, consent, retention, export, and deletion.

Care Circle

Family, caregivers, and viewers with recipient-specific roles.

Responsibilities

Owners, due dates, assignment, completion, and verification.

Ask Carestead chat

Grounded answers, visible evidence, and action proposals.

Memory & integrations

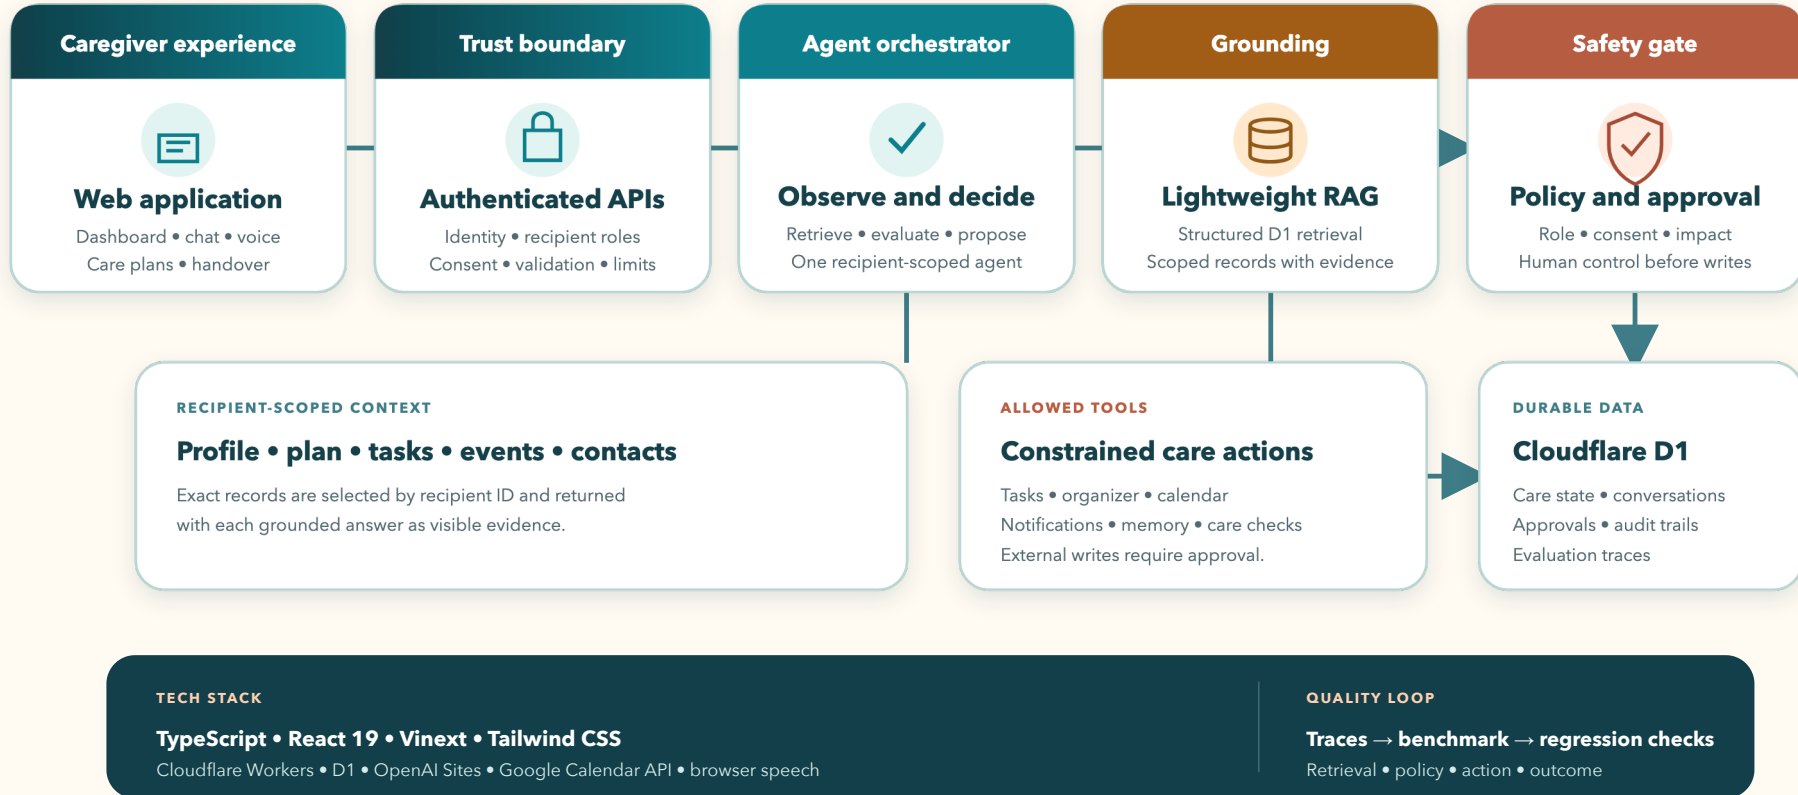

Source-linked D1 facts; connected services and optional Mem0.

Evaluation & audit

Trace evidence, decisions, tool calls, and outcomes.

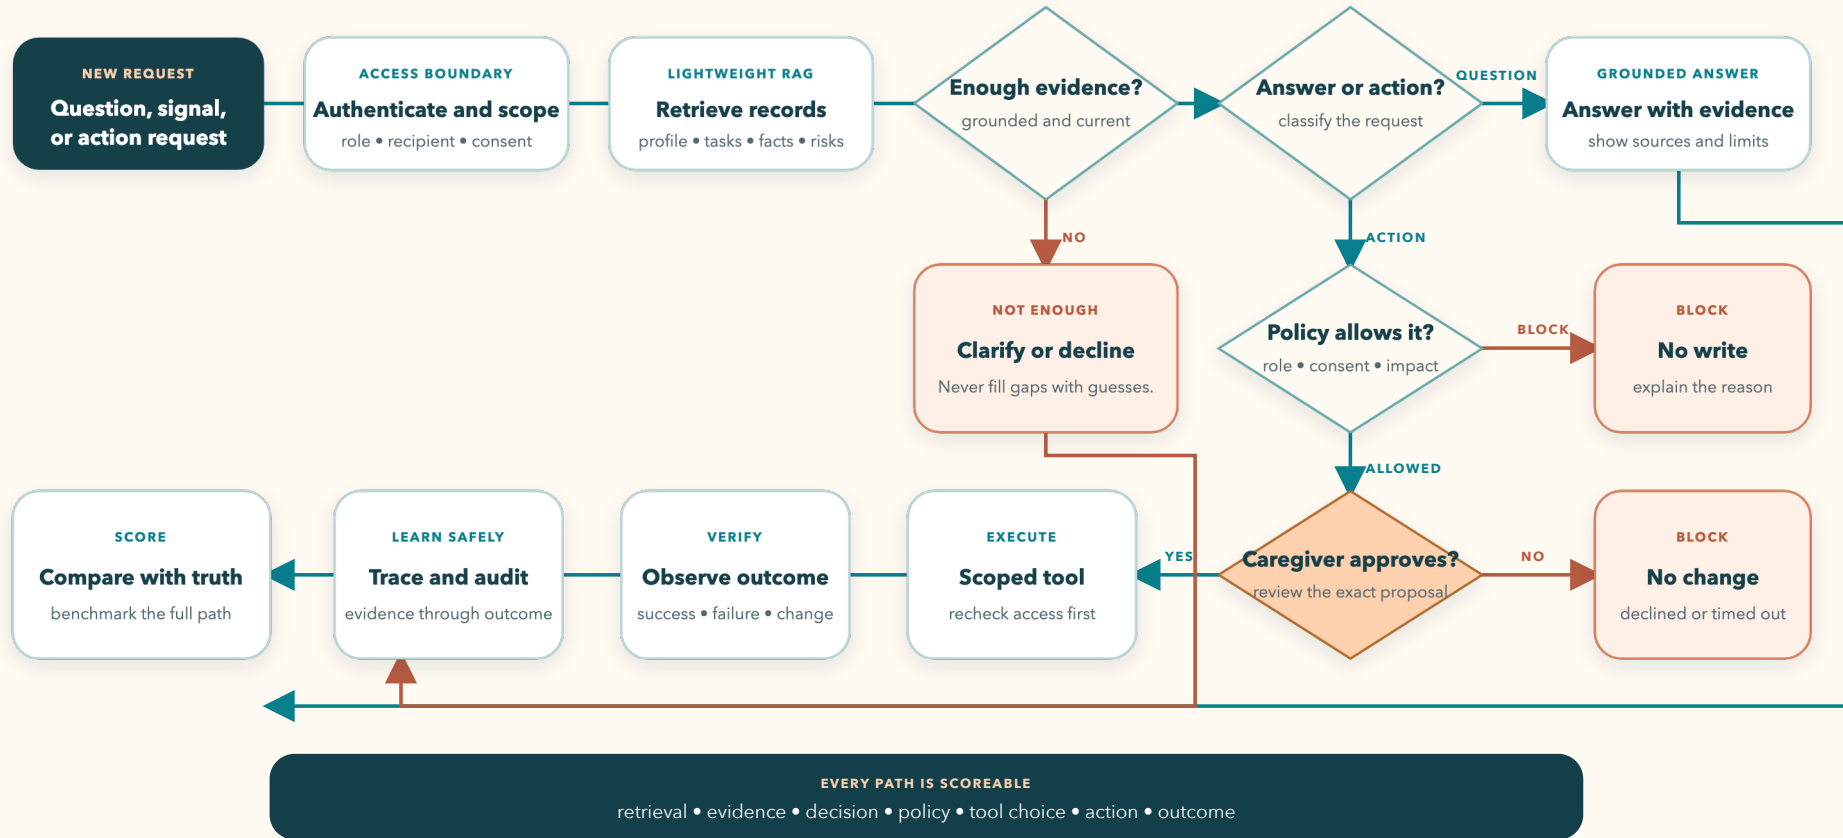

Carestead technical architecture

A SIMPLE, GROUNDED, APPROVAL-FIRST SYSTEM

Carestead decision path

GROUNDING ANSWERS • CONSTRAINED ACTIONS • HUMAN CONTROL

The agent proposes. Fixed rules and people control the action.

AGENT DECIDES

Relevant records, evidence sufficiency, risk severity and rationale, and a supported next step.

FIXED CONTROLS ENFORCE

Recipient access, consent, allowed tools, validation, approval rules, and integration scope.

CAREGIVER DECIDES

Approve or cancel the exact change; connect services; accept a practical care plan.

TOOL CALLS	WHAT THEY DO	CONTROL
Retrieve & care check	Read recipient records; evaluate coordination risks	Authorized scope and active consent
Responsibilities & organizer	Prepare tasks, assignments, schedules, and coverage	Review consequential proposals before writes
Calendar & notifications	Create / move events; release related notices	Approval + OAuth scope; held notices stay held
Memory, profile & handover	Maintain trusted facts and context; assemble a brief	Recipient role, consent, and input validation
Privacy tools	Export, retain, or delete recipient data	Owner-only or explicitly verified controls

Every action is traced. Never diagnose, change doses, judge a care interruption medically safe, or dismiss emergency care.

A measurable baseline. Visible failures to improve.

16 curated synthetic scenarios across seven categories · benchmark v1.0

76%

Evidence retrieval

Expected evidence strings matched

81%

Severity accuracy

Risk level matches ground truth

94%

Policy agreement

Approval flag matches the label

75%

Action accuracy

Action class matches ground truth

12 / 16 cases pass

Severity, approval, and action all match.

This pass count does not require perfect retrieval. These are regression scores, not clinical validation or measured caregiver benefit.

Four failures define the next work

- Unavailable transport owner → reassign
- Appointment overlap → resolve conflict
- Unanswered check-in → escalate
- Memory review need → flag stale context

A shared care picture. A clear next step.

For family caregivers coordinating changing care, Carestead brings the plan, people, and follow-through into one place.

THE VALUE FOR MAYA

Less to remember

Care Plan and trusted context keep the details together.

Responsibility that is shared

Care Circle and Care Organizer make ownership and coverage visible.

More confidence in the next step

Live handover, grounded answers, and reviewed actions explain what happens next.

FUTURE WORK · PROPOSED ROADMAP

Care that travels with you

A dedicated mobile app for quick updates and handovers.

More connected tools

Expand calendar, messaging, and care-service integrations. Explore a Carestead MCP server for scoped interoperability.

Prove the caregiver benefit

Expand evaluations and test with caregivers: coordination effort, completed tasks, and alert burden.

You Care. We Plan.
